

Documentations

1-The techniques used : HTML - CSS - Bootstrap - MySQL - php - laravel - ajax .

2- Adding exams for job candidates, the exam is done after applying for a job and the highest people who solve questions are nominated for an interview.

3- Adding questions by the company based on the required position and the examination will be opened after the completion of the required number of the job.

4 - The most important code excerpts is a way to display jobs based on the job seeker specialization.

5 - The company adds a job and adds a description of this job and the required skills and experiences, and all this information is displayed for job seekers on the jobs page.

6- Protection and verification of input fields. middleware for control panel, addition of authentication and authorization.

7- I researched how to create a relationship between the tables through which a job is added and the way it is presented to the job seeker based on specialization.

“ https://launchschool.com/books/sql/read/table_relationships”

8- “ Unlike our `addresses` table, the `PRIMARY KEY` and `FOREIGN KEY` reference different columns, `id` and `book_id` respectively. This means that the `FOREIGN KEY` column, `book_id` is not bound by the `UNIQUE` constraint of our `PRIMARY KEY` and so the same value from the `id` column of the `books` table can appear in this column more than once. In other words a book can have many reviews.”
